Cover image—The cover image shows fringe patterns that simulate the deformation field produced by a small ($M=5.2$) earthquake in California as observed by an ERS-1 radar interferogram (Feigl and Dupré, *Computers & Geosciences* 25(6), 695-704, fig. 3). For panel a, the focal mechanism is thrusting on a 3.1-km-wide fault terminating at 3.4 km depth, striking N106°. Subsequent panels show the effect of small variations in fault depth, strike and width. Further information can be obtained at <http://www.iamg.org/cgcover.html>
